## 1．2．2 Pyroelectric Energy Sensors

## $10 \mu \mathrm{~J}$ to 10J

## Features

－Ø46mm apertures
－Metallic coating for high rep rates
－BF coating for highest damage threshold
－Rep rates up to 10 kHz
－Measure lasers with pulse widths up to 20 ms

Energy Sensor with optional heat sink

| Note：（a）Calibration curve is verified and adjusted at specified wavelengths． <br> At other wavelengths，there may be an additional error up to the value given． | Max additional error at $2940 \mathrm{~nm} \pm 3 \%$ ． <br> Max additional error at other wavelengths：$\pm 2 \%$ ． ＜240nm not calibrated |  |  |  |  | Specified wavelengths： $193 \mathrm{~nm}, 248-266 \mathrm{~nm}, 355 \mathrm{~nm}, 532 \mathrm{~nm}$ and 1064 nm ． <br> Max additional error at $2940 \mathrm{~nm} \pm 3 \%$ ． <br> Max additional error at other wavelengths：$\pm 2 \%$ ． |  |  |  |  |
| Note：（b） |  |  |  |  |  | For wavelengths below 600 nm ，derate damage threshold to $60 \%$ of given values．Below 300 nm ，derate to $40 \%$ of given values． |  |  |  |  |
| Note：（c）With the＂user threshold＂setting set to minimum．For other settings，the spec is for $>7 \%$ of full scale or greater than twice the＂user threshold＂，whichever is greater． <br> The user threshold is not available with LaserStar，Nova／Orion，Pulsar，USBl and Quasar．For these meters，the threshold is set to minimum and the linearity spec is＞10\％of full scale．The PE－C series will only operate with Nova or Orion meters with an additional adapter Ophir P／N 7 Z08272（see page 110）．The adapter can introduce up to $1 \%$ additional measurement error． <br> The user threshold feature allows adjustment of the internal threshold up to $25 \%$ of full scale if desired to avoid false triggering in noisy environments． For further information，see the FAQs on our Website． |  |  |  |  |  |  |  |  |  |  |
| Note：（d）With the LaserStar，Pulsar，USBI，Quasar and Nova／Orion with adapter，only 2 out of 5 pulse widths settings are available；for the PE50－C model the $2 \mu \mathrm{~s}$（displayed as＂ $10 \mu \mathrm{~s}$＂）and 1 ms settings，and for the PE50BF－C model the 1 ms and 10 ms settings． |  |  |  |  |  |  |  |  |  |  |
| Note：（e）If the sensor is set to the 1064 nm wavelength，then when measuring $10.6 \mu \mathrm{~m}$ pulses，the reading will be approximately 1.19 X the correct reading．If you use the attenuate function and set the attenuation to read 0.84 ，then you will have the correct reading at $10.6 \mu \mathrm{~m}$ ．The additional error at $10.6 \mu \mathrm{~m}$ is $\pm 5 \%$ ． |  |  |  |  |  |  |  |  |  |  |
